Fisher's linear discriminant

- FLD seeks the projection **w** that gives a large distance between the projected data means while giving a small variance within each class

**LDA:**
maximizing the component axes for class-separation

bad projection

good projection: separates classes well

$$J(\boldsymbol{W}) = \frac{(m_2 - m_1)^2}{s_1^2 + s_2^2}$$

Between-class variance

Within-class variance

Question 6

1. Projection line
2. Colorize the data points
3. Project the data points into projection line

Projection Line: w=6.927700253626869, b=-7.869534160754503

Late Policy

- We will deduct a late penalty of 20 points per additional late day
- For example, If you get 90 points of HW2 but delay for two days, your will get only 90- (20 x 2) = 50 points!
